

Project 7b – Navigation Bars

Every site needs a good navigation bar. And sites with many links are likely to need a way to present all those links in a consolidated way – the drop-down navbar.

1. Examine the provided HTML files and the existing navigation structure.
2. Create a jQuery-based navigation bar that will allow you (or me) to add 1st level, 2nd level, or 3rd level items to the menu.
3. Home, Web, and Database should be the only links that display on page load.
4. Follow the non-styled HTML structure for the menu layout:
 - a. Home does not have any sub-items.
 - b. Web has 4 level-2 items and Web-215 has 2 level-3 items.
 - c. Database has 2 level-2 items.
5. Either write by hand or use a jQuery plug-in to create a fully functioning menu system that can be expanded to include more links by simply adding to the HTML UL structures.
6. Your plug-in may come with its own CSS. If necessary, edit the CSS or write your own to achieve a professional final result.
